

Project Description

Yanli Wang | CS5610 | Portfolio Project

a personal portfolio website that introduces me, Yanli Wang, as a computer science master's student and two projects in natural language processing and computer vision. The website will help recruiters and potential collaborators understand my background, experience, and project work.

Website content

Homepage. A short personal introduction, my academic background and interests, links to both project pages, and my GitHub profile.

NLP project. An overview of my team project with Zheyu Deng on YouTube comment sentiment and video like rate. The page will explain the research question, methods, my contribution, results, and limitations, with a link to the project repository.

Computer vision project. An overview of my individual CS5330 project on human skeleton detection and motion analysis. The page will show the MediaPipe-based workflow, screenshots, a recorded demonstration, and squat analysis results.

Creative feature

A small motion explorer will let visitors select Standing, Walking, Hand Raising, or Squat to change the displayed project image and its description. This original JavaScript feature will contain more than five lines of code and use saved outputs from the vision project.

Technical plan

The site will have three separate pages: index.html, nlp.html, and vision.html. I will use vanilla HTML5, CSS3, and ES6 modules, with no backend, component libraries, or jQuery. The website will support desktop screens and will be published using GitHub Pages.

The vision page will be the third AI-generated page. I will review its content and code, and document AI tools, models, available version information, prompts, and edits in the README.
